

SWITCHERS, QUADS & MULTIPLEXERS

We offer a full range of high quality analogue control equipment, including 4 and 8 Camera Switcher Units, a powerful Quad unit and a range of 4, 8 and 16 Camera multiplexers. All our analogue control equipment is compatible with all standard CCTV Cameras and VCR units.

Choosing the ideal Controller

Switchers

Allow you to select each camera you wish to view manually or automatically. Switchers simply switch cameras from one camera to the other (similar to how you would select TV channels on your TV), in automatic mode they will select each camera in sequence automatically every few seconds. When connected to a video recorder the video will record whichever camera the switcher has selected or that you manually select.

Quads

Allow you to view all the cameras as a quad image (all 4 cameras on one screen, each fills a 1/4 of the screen). During viewing you can select any camera to full screen, set the cameras to automatically sequence or view them as a quad image, the unit will record exactly what you select during live viewing.

Multiplexers

Allow you to view up to 16 cameras on one screen. Cameras can be viewed as a full screen, quad image, and various split screen images up to 16 camera split screen. Multiplexers allow you to record (when connected to a video recorder) all of the cameras as a full screen image at the same time, this then allows you to view the cameras full screen, as a quad image, and various split screen images up to 16 camera split. During recording you can select any camera, quad or split screen view without effecting the recording.
